

Canopy Next Gen Presentation Abstract:

The Perfect Storm - A Five Year Feedstock Shift Forecast

Regulatory and voluntary shifts towards low-carbon and circular manufacturing are already playing a major role in key production and purchasing regions of the world. With forest protection recognized as a significant part of the solution to the twin crises of climate change and biodiversity loss, and the price of wood projected to continue to rise over the coming decade, there is an urgent need for the cellulosic materials sector to adapt. In this context, development of technologies to utilize alternative low-carbon cellulosic feedstocks is flourishing. Canopy will speak about the factors that will accelerate the production and purchasing of Next Gen MMCF over the next five years and how this will change the industry's perception of itself as a forest product sector.
