LIST Abstract 2

Practical Insights into the Cellulosic Fiber Development

LIST is the provider of the Dissolving Technology Platform in many projects at various development stages. Hereby LIST provides hardware and guidance on the long path from the first biomass to the start-up of an industrial plant. Always complementing the customer’s own competences specifically to the biomass, solvent, timeline, customer inhouse capacities and competence. Closely interwoven with research but always with the focus on an industrialization.

The presentation will share the generalized experience of a typical development project from the first biomass to the start-up of the first industrial scale from a dissolving point of view, as one of the crucial processing steps.

Goal is to contribute to the decisions making of fiber innovators about the organization and management of cellulose fiber innovation projects.
